Introduction

The Health and Safety Assessment has been completed in support of the Idaho Department of Health and Welfare's objective to "collect, assemble, and publish information on the status of the health and safety of Idahoans." This is the second report of its kind. This first Idaho Health and Safety Assessment (April 2001) was used to identify core indicators that the Department then prioritized. The priorities chosen were Alcohol, Tobacco, and Other Drugs (ATOD). In the intervening years we have produced updates to track ATOD-related data. The most recent update follows the Summary of Findings.

The presented data provide an overview of the status of health and safety issues facing the state. The Department will use this data as the basis for setting priorities, developing strategies to address identified issues, allocating resources, and evaluating the impact of efforts on improving the health and safety of Idahoans.

The data included in this report are from a variety of sources (see pages 72-78 for an inclusive data source list).

Summary of Findings

As in the first Idaho Health and Safety Assessment (IHSA), the Data Work Group began by identifying Diseases and Conditions that significantly impact the health of Idahoans.

The diseases and conditions considered in this publication are:

Bloodborne Diseases	Intentional Injuries
Hepatitis B	Homicide
Hepatitis C	Suicide
Human Immunodeficiency Virus	
Cancer	Oral Health
Cardiovascular Diseases	Respiratory Diseases
Chronic Lower Respiratory Diseases	Influenza
Diabetes	Pneumonia
Enteric Diseases	Sexually Transmitted Diseases
<i>E. Coli</i> O157:H7	Chlamydia
Hepatitis A	Gonorrhea
<i>Salmonella</i>	
Infant Mortality	Unintentional Injuries
Birth Defects	Nontransport
Low Birth Weight	Transport
Sudden Infant Death Syndrome	Work-Related Injuries

The Data Work Group chose to retain most of the diseases and conditions found in the first IHSA, although some reorganization has been done. A review of the Leading Causes of Death and Years of Potential Life Lost reveals that the same health issues that existed in 2001 exist now. Most data available in this publication are updated as of 2004.

Although the initial work identified outcomes (i.e., diseases and conditions) the focus of the Data Work Group shifted to the risks for the diseases and conditions. Risk-based intervention can help avoid the long term human and economic costs of these diseases and conditions.

Because the selected diseases and conditions have multiple causes, determining the relative contributions of the various risk factors is extremely difficult. These factors may act independently of one another, their effects may be additive, or they may present a greater risk in combination than the sum of their individual effects.

Summary of Findings

A review of these risk factors suggests that the most prominent identifiable contributors to death among Idaho residents are:

Diet and Exercise

- Excessive weight
- Poor diet
- Sedentary life style

Substance Use

- Alcohol abuse
- Tobacco use
- Illicit drug use

Personal Health Habits

- Lack of immunizations
- Improper food handling
- Improper hand washing

Personal Safety

- Not wearing helmets
- Not using safety restraints
- Loaded gun in home

Risky Sexual Behaviors

- Unprotected sex
- Multiple sexual partners
- High risk sexual practices/IV drug use

The following pages present trends of these risk factors, when available, and references to relevant diseases and conditions. See pages 70 and 71 for risk factor definitions.

Alcohol, Tobacco, and Other Drugs

Alcohol Abuse

Heavy drinking is defined as consuming 60 or more drinks of alcohol per month, and binge drinking is defined as consuming five or more drinks on one or more occasions in the past 30 days. Alcohol use may contribute to cancer, cardiovascular diseases, chronic liver disease, unintentional and intentional injuries, infant mortality, and oral health conditions. Alcohol use during pregnancy can severely jeopardize birth outcomes and lead to fetal alcohol affects and fetal alcohol syndrome.

Related Trends

Risk Factors	1995	1996	1997	1998	1999	2000	2001	2002	2003	2004
Binge Drinking: Adults who consumed five or more drinks of alcohol on one or more occasions in the past 30 days										
Percent	13.1	14.7	14.9	14.8	14.7	14.9	12.8	15.7	15.6	12.8
Heavy Drinking: Adults who consumed 60 or more drinks of alcohol in the past 30 days										
Percent	2.8	3.3	3.0	3.6	3.5	4.3	4.9	5.3	5.8	4.8

No morbidity data are available.

Idaho Resident Deaths	1995	1996	1997	1998	1999*	2000*	2001*	2002*	2003*	2004*
Alcohol-Related										
Age-adjusted Rate	8.2	8.0	8.7	7.5	7.5	8.9	9.8	9.7	10.0	8.4
Number	87	87	97	86	89	107	122	125	134	116

Rates are per 100,000 population. The 1995-1998 data have NOT been modified to be comparable to 1999-2004 data. The age-adjusted rates have been standardized to year 2000. For additional information regarding Modified ICD-9 codes, comparability ratios, ICD-10 codes, and/or age-adjustment, see **Technical Notes** at the end of this report.

* The ICD-10 codes for alcohol-related deaths was expanded for ICD-10 to be more comprehensive. Therefore, data for 1999-2004 are not comparable to data for 1995-1998. See **Data Sources and Notes** for further explanation.

Highlights

- From 1995 to 2004, the prevalence of heavy drinkers increased by 71.4 percent, from 2.8 percent in 1995 to 4.8 percent in 2004.
- In 2003, 23.4 percent of Idaho high school students reported consuming five or more drinks in a single occasion in the previous 30 days. The prevalence was 25.0 percent for males and 21.7 percent for females.
- From 1995-2004, the age-adjusted rate of alcohol-related deaths has fluctuated, ranging from a low of 7.5 in 1998 and 1999 to a high of 10.0 in 2003.
- In 2003, 22.5 percent of Idaho high school students reported that they had their first drink of alcohol before age 13, which was 18.5 percent lower than the 27.6 percent reported in 2001.

Alcohol Abuse

Risk Factor	Baseline		Current	
	Percent	Year	Percent	Year

* Note: the listed causes of death are not mutually exclusive.

** Rate: number of deaths per 100,000 population; rates are age-adjusted, standardized to year 2000 U.S. standard million.

Tobacco Use

Individuals at-risk for cigarette smoking are defined as anyone who has ever smoked 100 cigarettes or more and who now smokes some days or everyday. Thirty percent of all cancers are attributed to smoking or chewing tobacco. Cigarette smoking is associated with cancers of the lung, mouth, pharynx, larynx, esophagus, pancreas, kidney, and bladder. Tobacco use also contributes to Cardiovascular diseases and Chronic lower respiratory diseases. Women who smoke during pregnancy increase the risk of spontaneous abortions, pre-term births, low birth weight babies, and fetal and infant deaths.

Related Trends

Risk Factors	1995	1996	1997	1998	1999	2000	2001	2002	2003	2004
Current Smoker: Adults who had ever smoked at least 100 cigarettes and who currently smoke cigarettes everyday or some days										
Percent	19.8	21.1	19.9	20.3	21.5	22.3	19.6	20.7	18.9	17.4

Percent	4.0	4.5	NA	3.6	NA	3.3	4.8	NA	4.6	5.0

No morbidity data are available.

Idaho Resident Deaths	1995	1996	1997	1998	1999	2000	2001	2002	2003	2004
Malignant neoplasm of trachea, bronchus, and lung										
Age-adjusted Rate	46.0	45.1	47.2	47.5	43.6	45.7	45.0	43.6	46.1	41.2
Number	483	485	518	532	502	538	539	538	591	537

Rates are per 100,000 population. Statistics for 1995-1998 have been revised using the Modified ICD-9 codes and comparability ratios. The age-adjusted rates have been standardized to year 2000. For additional information regarding Modified ICD-9 codes, comparability ratios, ICD-10 codes, and/or age-adjustment, see **Technical Notes** at the end of this report.

Highlights

- The prevalence of smoking among Idaho adults has decreased in the last decade. 17.4 percent of Idaho adults reported that they currently smoke in 2004, down 12.1 percent from the 19.8 percent reported in 1995.
- The percent of Idaho adults who reported they currently use smokeless tobacco has remained relatively stable, ranging from a low of 3.3 in 2000 to a high of 5.0 in 2004.
- In 2004, 19.1 percent of smokers reported "fair" or "poor" general health compared with only 11.1 percent of non-smokers.
- The age-adjusted lung cancer death rate has fluctuated only slightly in the past ten years. In 2004, 537 Idahoans died due to cancer of the lung, bronchus, and trachea. Of these, 56.4 percent were male and 43.6 percent were female.

Tobacco Use

Risk Factor	Baseline		Current	
	Percent	Year	Percent	Year
Current smoker				
All ages (18+)	22.3%	2000	17.4%	2004
18-34	26.4%	2000	19.1%	2004

Females	242	36.4	265	36.4

* Rate: number of deaths per 100,000 population; rates are age-adjusted, standardized to year 2000 U.S. standard million.

Illicit Drug Use

Intravenous and other illicit drug use has been linked to conditions such as Hepatitis A, Hepatitis B, Hepatitis C, Human Immunodeficiency virus (HIV), cancer, cardiovascular diseases, low birth weight births, intentional and unintentional injury, violence, and crime.

Risk Factors	1995	1996	1997	1998	1999	2000	2001	2002	2003	2004
Illicit Drug Use: Adults who reported using drugs for non-medical purposes in the last 12 months										
Percent	NA	NA	5.5	5.0	5.5	5.4	6.1	5.8*	6.5*	5.8*
Drug/Narcotic Arrests: Arrests in Idaho for drug/narcotic offenses										
Rate	424.3	352.3	395.5	412.0	412.6	418.3	401.7	414.2	417.9	NA
Number	4,935	4,189	4,785	5,064	5,166	5,349	5,244	5,509	5,664	NA

* The question regarding illicit drug use changed in 2002. Data from 2002-2004 are not comparable to data from 1995-2001.

Arrest rates may differ from previous publications due to an adjusted population base which reflects only the crime reporting jurisdictions. Arrest rates are per 100,000 of the adjusted population.

Numbers and rates for drug/narcotic arrests are not available for 2004

No morbidity data are available.

Idaho Resident Deaths	1995	1996	1997	1998	1999	2000	2001	2002	2003	2004
Drug-Induced										
Age-adjusted Rate	4.8	4.5	5.3	4.9	5.3	5.5	7.9	9.3	9.0	8.2
Number	52	49	60	58	64	69	100	120	117	111

Rates are per 100,000 population. The 1995-1998 data have NOT been modified to be comparable to 1999-2004 data. The age-adjusted rates have been standardized to year 2000. For additional information regarding Modified ICD-9 codes, comparability ratios, ICD-10 codes, and/or age-adjustment, see **Technical Notes** at the end of this report.

The ICD-10 codes for drug-induced deaths was expanded for ICD-10 to be more comprehensive. Therefore, data for 1999-2004 are not comparable to data for 1995-1998. The question 'Did tobacco use contribute to cause of death' was added to the Idaho death certificate in 2003. Therefore, data for 2003 and 2004 are not comparable to data for 1999 through 2002. See **Data Sources and Notes** for further explanation.

Highlights

- In 2003, there were 5,664 arrests for drug and narcotic offenses. Between 1995 and 2003 the arrest rate for drug offenses increased 46.5 percent. The greatest increase was among the female population which experienced a rate increase of 76.0 percent while the male rate increased 39.1 percent.
- In 2004, 111 Idahoans died from drug-related causes.
- In 2003, 30.6 percent of Idaho high school students reported that they had used marijuana one or more times during their life, which was 11.8 percent lower than the 34.7 percent reported in 2001.

Illicit Drug Use

Risk Factor	Baseline		Current	
	Percent	Year	Percent	Year
Illicit drug use in the past 12 months				
All ages (18+)	5.8%	2002	5.8%	2004

Cocaine used one or more times during their life				
Students grades 9-12	7.3%	2001	6.2%	2003
Heroin used one or more times during their life				
Students grades 9-12	3.0%	2001	1.7%	2003
Methamphetamines used one or more times during their life				
Students grades 9-12	7.2%	2001	5.6%	2003
Inhaled paint/sprays or sniffed glue to get high one or more times during their life				
Students grades 9-12	14.3%	2001	14.3%	2003

Cause of death	Baseline 2000		Current 2004	
	Number	Rate*	Number	Rate*
Total drug-induced deaths	69	5.3	111	8.0
Mental and behavioral disorders due to psycho-active substance abuse	5	0.4	13	0.9
Accidental poisoning	32	2.5	66	4.7
Intentional self-harm (suicide)	19	1.5	16	1.1
Assault (homicide)	1	0.1	-	-
Undetermined Intent	12	0.9	16	1.1

* Crude Rate: number of deaths per 100,000 population.
Crude rates differ from age-adjusted rates.

Diseases and Conditions

Bloodborne Diseases: Hepatitis B, Hepatitis C, and HIV

Hepatitis B is a serious liver disease caused by the hepatitis B virus (HBV). Hepatitis B can cause acute illness that leads to loss of appetite, tiredness, diarrhea, jaundice, and pain in muscle, joints, and stomach. It can also cause chronic illness that leads to cirrhosis, liver cancer, and death.

Hepatitis C is a liver disease caused by the hepatitis C virus (HCV), which is found in the blood of persons who have the disease. Most persons who get hepatitis C carry the virus for the rest of their lives. Although most of those persons will have some liver damage, many do not feel sick from the disease. Some with liver damage may develop cirrhosis and liver failure which may take many years to develop.

Human immunodeficiency virus (HIV) is the disease that causes acquired immunodeficiency syndrome (AIDS). HIV infects and kills the body's CD4 cells that help fight off infection and disease. This virus is passed from one person to another through blood-to-blood and sexual contact.

HIV/AIDS (Prevalence)	Rate	36.2	38.7	42.0	44.1	47.3	52.2	52.9	54.6	56.5	57.8
	Number	422	460	508	542	592	675	699	732	772	805

Rates are per 100,000 population. The "AB" cases refer to persons who are/were infected, but a second blood sample was NOT taken 6 months later; therefore, it was undetermined whether the person developed a chronic infection.

Incidence rate: the rate at which new events occur in a population. Prevalence: the number of events in a given population at a designated point in time.

The Department began collecting data on chronic or resolved cases during the latter part of 1997, thereby causing the increases in total reported hepatitis C cases in 1997 through 2004.

Bloodborne Diseases: Hepatitis B, Hepatitis C, and HIV

Idaho Resident Deaths		1995	1996	1997	1998	1999	2000	2001	2002	2003	2004
Hepatitis B	Crude Rate	0.2	0.1	0.1	0.3	0.0	0.1	0.2	0.1	0.1	0.1
	Number	2	1	1	4	0	1	3	1	2	1
Hepatitis C	Crude Rate	0.3	0.4	0.6	1.1	0.9	1.1	0.7	1.0	0.7	0.6
	Number	3	5	7	13	11	14	9	13	9	8
HIV	Crude Rate	4.3	2.4	1.1	1.1	0.4	0.9	0.8	0.7	0.8	0.2
	Number	50	28	13	14	5	11	11	10	11	3

Rates are per 100,000 population. The 1995-1998 data for Hepatitis B and C have NOT been modified to be comparable to 1999-2004 data. Statistics for 1995-1998 for HIV have been revised using the ICD-9 codes and comparability ratios. Due to small numbers, age-adjusted rates were not calculated. For additional information regarding Modified ICD-9 codes, comparability ratios, and/or ICD-10 codes, see **Technical Notes** at the end of the report.

Highlights

- From 1995-2004, the rate of hepatitis B in Idaho has remained relatively constant, ranging from a low of 0.1 in 2001, to a high of 0.3 in 1998 and 2003.
- Hepatitis C virus is the most common chronic bloodborne infection.
- From 1995-2004, the Idaho mortality rate of hepatitis C has remained relatively constant, ranging from a low of 0.3 in 1995 to 1.1 in 1998 and 2000.
- The hepatitis B vaccine has been recommended as a routine infant vaccination since 1991, and as a routine adolescent vaccination since 1995.
- Hepatitis B, hepatitis C and HIV are reportable diseases in Idaho. It is a felony in Idaho to knowingly infect someone with HIV.

Illicit Drug Use by Age and Sex,
Idaho, 2004

Cancer

Cancer is not one disease, but a constellation of more than 100 different diseases, each characterized by the uncontrolled growth and spread of abnormal cells.

Highlights

- Cancer was the second leading cause of death in the U.S. (2002) and Idaho (2004).
- One of every four Idaho resident deaths in 2004 was caused by cancer.
- Cancer was the leading cause of death among persons aged 45-74 in 2004.
- Lung cancer was the leading cause of cancer deaths for both Idaho men and women in 2004.
- Adults who currently smoke, a risk factor for lung cancer, has fluctuated slightly, ranging from a high of 21.5 percent in 1999 and a low of 17.4 percent in 2004.

Highlights

- The age-adjusted Cardiovascular diseases death rates from 1995-2004 indicate a downward trend, decreasing 21.4 percent during the 10 year period.
- Cardiovascular diseases deaths include Diseases of heart and Cerebrovascular diseases (stroke), the first and third leading causes of death in the U.S. (2002) and Idaho (2004), respectively.
- One of every three Idaho resident deaths in 2004 was caused by Cardiovascular diseases.
- The percent of adults who have ever been told they have high cholesterol has increased from 28.1 percent to 31.1 percent from 1995 to 2003, among those who have been checked.

Chronic Lower Respiratory Diseases

Chronic lower respiratory diseases are characterized by permanent airflow obstruction. They include asthma, chronic bronchitis, emphysema, and other chronic lower respiratory diseases and allied conditions and are a major cause of chronic morbidity and mortality.

Highlights

- In 2004, Chronic lower respiratory diseases (CLRD) was the fourth leading cause of death in Idaho, accounting for approximately six percent (573) of the deaths.
- Among Idahoans aged 55-64 or 75 and older, CLRD was the fourth leading cause of death and the third leading cause among persons 65-74.
- In 2004, approximately one-in-thirteen adults had ever been told they have asthma.

Diabetes

Diabetes mellitus is a group of diseases characterized by high levels of blood glucose resulting from defects in insulin secretion, insulin action, or both.

Highlights

- Diabetes was the sixth leading cause of death among Idaho residents in 2004.
- The age-adjusted death rate per 100,000 population has increased 28.4 percent from 1995 (20.4) to 2004 (26.2).

Enteric Diseases: *E. Coli* 0157:H7, Hepatitis A, and *Salmonella*

E. coli O157:H7 is one of hundreds of strains of the bacterium *Escherichia coli*. Although most strains are harmless and live in the intestines of healthy humans and animals, this strain produces a powerful toxin that can cause severe illness.

Hepatitis A is a serious liver disease caused by the hepatitis A virus (HAV). Hepatitis A can cause mild "flu-like" illness, jaundice, severe stomach pains, and diarrhea and often requires hospitalization.

Salmonellosis is an infection caused by the *Salmonella* bacteria. Most people who become ill with *Salmonella* develop diarrhea, cramping, and fever within 12-72 hours after exposure to the organism. In some cases, the diarrhea becomes so severe the infected person requires hospitalization. The illness typically lasts 4-7 days.

For additional information regarding Modified ICD-9 codes, comparability ratios, and/or ICD-10 codes, see **Technical Notes** at the end of the report.

Enteric Diseases: *E. Coli* 0157:H7, Hepatitis A, and *Salmonella*

Highlights

- There were seven Idaho resident deaths caused by hepatitis A from 1995 to 2004, 85.7 percent of these were women.
- The number of reported cases of *E.Coli* 0157:H7 has fluctuated, ranging from a high of 85 in 2003 to a low of 40 in 1996 and 1997.

Infant Mortality

The infant mortality rate is made up of two components: neonatal mortality (death in the first 27 days of life) and postneonatal mortality (death after the first 27 days but within the first year).

Birth defects are the leading cause of infant mortality in the U.S., accounting for more than 20% of all infant deaths. The causes of about 70% of all birth defects are unknown.

A low birth weight (LBW) baby is an infant weighing under 2,500 grams (5 1/2 pounds or less) at the time of birth. LBW can be due to preterm delivery (less than 37 weeks gestation) or infants born at full term but small-for-gestational age, a condition known as intrauterine growth retardation (IUGR).

Sudden Infant Death Syndrome (SIDS) is a term used to describe the sudden, unexplained death of an infant that remains unexplained after a thorough case investigation that includes a complete autopsy, an examination of the death scene, and a review of the clinical history.

	Number	22	26	21	21	21	12	16	13	19	19

Rates are per 100,000 live births. Statistics for 1995-1998 have been revised using the Modified ICD-9 codes and comparability ratios. For additional information regarding Modified ICD-9 codes, comparability ratios, and ICD-10 codes, see **Technical Notes** at the end of this report.

Highlights

- The leading causes of Idaho resident infant deaths in 2004 was birth defects and low birth weight.
- One of every five Idaho resident infant deaths was caused by birth defects.
- Birth defects were the sixth-leading cause of years of potential life lost before age 75 in Idaho in 2004.
- In 2004, there were 139 infant deaths. Of the 136 with known birth weight data, 84 (61.8 percent) were born low birth weight.
- Sudden infant death syndrome (SIDS) was the third leading cause of all 2004 Idaho resident infant deaths.
- All of the SIDS deaths occurred during the postneonatal period in 2004.
- SIDS was the leading cause of 2004 Idaho resident postneonatal deaths.
- Idaho's SIDS death rate has declined 31.0 percent since 1995, despite some fluctuations.

Intentional Injuries: Homicide and Suicide

Homicide is defined here as death due to injuries purposely inflicted by another person, not including deaths caused by law enforcement officers or legal execution.

Mental disorders such as various forms of depression, schizophrenia, panic disorder, adjustment and stress reactions as well as alcohol and other drug abuse have been implicated in both attempted and completed suicides.

For additional information regarding Modified ICD-9 codes, comparability ratios, ICD-10 codes, and/or age-adjustment, see **Technical Notes** at the end of this report.

Intentional Injuries: Homicide and Suicide

Highlights

- On average in 2004, one Idaho resident died from homicide every 11 days.
- Suicide was the eighth leading cause of death among Idaho residents in 2004.
- Among Idahoans aged 15 to 34, suicide was the second leading cause of death in 2004.
- In 2004, suicide was the fourth leading cause of years of potential life lost before age 75 in Idaho.

Oral Health

Oral health means much more than healthy teeth. It means being free of chronic oral-facial pain conditions, oral and pharyngeal cancers, oral soft tissue lesions, birth defects, and other disorders that affect the oral, dental, and craniofacial tissues.

Respiratory Diseases: Influenza and Pneumonia

Influenza is caused by a virus that spreads from infected persons to the nose or throat of others. The Influenza Branch at the Center for Disease Control and Prevention collects and reports information on influenza activity in the U.S. each week from October through May.

Streptococcus pneumoniae (pneumococcus) is the most common cause of community-acquired bacterial pneumonia, occurring most frequently among the elderly and young children. The precise evidence of pneumococcal pneumonia is difficult to ascertain because routine diagnostic tests are insufficiently specific and sensitive; however, it is estimated that *s. pneumoniae* accounts for approximately 25-35% of cases of community-acquired bacterial pneumonia in persons who require hospitalization.

Related Trends

Age-adjusted Rate	21.7	19.1	21.9	22.1	21.1	22.9	19.1	20.8	23.8	16.3
Number	215	197	232	246	242	268	233	258	312	220

Rates are per 100,000 population. Statistics for 1995-1998 have been revised using the Modified ICD-9 codes and comparability ratios. Due to small numbers, age-adjusted rates were not calculated for influenza deaths. The age-adjusted rates for pneumonia have been standardized to year 2000. For additional information regarding Modified ICD-9 codes, comparability ratios, ICD-10 codes, and/or age-adjustment, see **Technical Notes** at the end of this report.

Highlights

- From 1995 to 2004, the rate of influenza deaths has fluctuated from a high of 3.0 in 1999, to a low of 0.1 in 2004.
- In 2004, 31.2 percent of Idaho adults reported having had a flu vaccine during the past year.
- During the past ten years, the Idaho age-adjusted pneumonia mortality rate has fluctuated from a high of 23.8 in 2003, to a low of 16.3 in 2004.
- Pneumonia and influenza combined was the ninth leading cause of Idaho resident deaths in 2004.
- In 2004, 39.8 percent of Idaho adults over 65 reported they had never received a pneumonia vaccination.

Sexually Transmitted Diseases: Chlamydia and Gonorrhea

Chlamydia is a sexually transmitted disease (STD) that is caused by the bacterium *Chlamydia trachomatis*. Untreated, chlamydia can cause severe, costly reproductive and other health problems which include both short- and long-term consequences.

Gonorrhea is an STD that is caused by the bacterium *Neisseria gonorrhoeae*. The bacteria can grow and multiply easily in mucous membranes, including the reproductive and urinary tracts, the anus, mouth, and throat. Gonorrhea can cause serious and permanent problems in both men and women.

Rates are per 100,000 population. See **Technical Notes** at the end of this report.

Highlights

- Of the sexually transmitted diseases reported in Idaho in 2004, chlamydia accounted for the most cases reported.
- From 1995 to 2004, the rate of chlamydia cases increased 44 percent.
- The number and rate of gonorrhea cases reported in Idaho have fluctuated from 1995 through 2004, with 2003 reflecting the lowest incidence rate of 5.0 and 1998 the highest rate of 14.7.

Unintentional Injuries: Transport and Non-Transport

Transport injury includes accidents involving motor vehicles, watercraft, trains, airplanes, and other transport craft. Motor vehicle crashes are a major public health problem accounting for approximately half of the deaths from accidental injuries.

In addition to transport crashes, injury deaths are due to a variety of causes such as firearms, poisonings, suffocation, falls, fires, and drowning.

Highlights

- In 2004, there were 312 Idaho resident deaths caused by nontransport unintentional injuries.
- In 2004, falls were the most common cause of nontransport unintentional injury deaths, accounting for 114 of the 312 deaths. Over 73 percent of the deaths attributed to falls were to people over the age of 75.
- In 2004, Idaho resident deaths resulting from motor vehicle accidents represented 88.4 percent of all transport injury deaths. 72 percent of the motor vehicle accident deaths were males.
- The proportion of Idaho adults always wearing their seatbelt has been increasing during the past 10 years; however, 32.7 percent of the adults surveyed in 2003 still do NOT always wear their seatbelts.

Work-Related Injury

Motor vehicle crashes are the leading cause of occupational fatalities in virtually every division of U.S. industry. According to Healthy People 2010, workplace homicide became the second-leading cause of occupational deaths in 1990. Other causes include falls, non-highway industrial vehicular injuries, blows other than by vehicles or equipment, and electrocutions.

Work-related injury deaths include unintentional and intentional injuries occurring at work (excluding suicides). Statistics reflect all work-related injury deaths occurring in Idaho, regardless of the decedent's residence. Rates are per 100,000 full-time and part-time covered workers. See **Data Sources and Notes** at the end of this report.

Highlights

- On average in 2004, one work-related injury death occurred in Idaho every ten days.
- In 2004, 97.4 percent of the Idaho work-related injury deaths occurred among males.

1. In 2003, a question on pregnancy status among females aged 10-54 was added to the Idaho death certificate.

2. Number, rate, and ratio of induced abortions in 1995-2001 may differ slightly from data published previously by the Bureau of Health Policy and Vital Statistics due to revisions in the database.

Rates for 1994-1999 are based on population estimates calculated using the 1990 Census from the U.S. Census Bureau, Internet release March 9, 2000. Rates for 2000 are based on 2000 Census, Internet release date August 1, 2001. Estimates for 2001-2004 are based on the 2000 Census, U.S. Census Bureau and National Center for Health Statistics, Internet release August 8, 2003, April 9, 2004 and April 14, 2005.

Marriage, divorce, and specified induced abortion data are for events occurring in Idaho; all other data reflect events occurring to Idaho residents.

Exact Age in Years	Average Number of Years of Life Remaining (e_x)		
	Total	Male	Female
0	79.0	76.6	81.4
1	78.5	76.1	80.8
5	74.6	72.3	76.9
10	69.7	67.4	72.0
15	64.7	62.5	67.0
20	60.0	57.8	62.1
25	55.2	53.1	57.2
30	50.4	48.5	52.4
35	45.6	43.7	47.5
40	41.0	39.1	42.7
45	36.3	34.6	38.0
50	31.9	30.2	33.4
55	27.5	26.0	28.8
60	23.2	21.8	24.5
65	19.2	18.0	20.3
70	15.6	14.4	16.5
75	12.3	11.4	13.0
80	9.6	8.9	10.0
85	7.5	7.0	7.7

U.S. life expectancy in 2002 was 77.3 years, 74.5 years for males, and 79.9 years for females.
 See **Technical Notes** for methodology.

LIFE EXPECTANCY AT BIRTH
By District of Residence
2004

Residence	Average Number of Years Life Expectancy at Birth		
	Total	Male	Female
Idaho	79.0	76.6	81.4
District 1	78.6	76.0	81.3
District 2	79.2	76.7	81.9
District 3	78.5	75.9	81.1
District 4	79.8	77.6	81.8
District 5	78.9	76.3	81.8
District 6	78.0	75.5	80.6
District 7	78.9	77.0	80.7

See **Technical Notes** for methodology.

Definitions and Notes

Risk Factor Definitions

Risk Factor:	Definition:
Adults Who Did Not Always Wear Bicycle Helmets	Adults who did not always wear a bicycle helmet when riding a bicycle (among those who rode bicycles).
Asthma	Adults who had ever been told they had asthma by a doctor, nurse, or other health professional and reported they still had asthma.
Binge Drinking	Adults who consumed five or more drinks of alcohol on one or more occasions in the past 30 days.
Cervical Cancer Screening	Women with an intact cervix who had not had a Pap test in the previous three years.
Children Who Did Not Always Wear Bicycle Helmets	Children aged 5 to 15 who did not always wear a bicycle helmet when riding a bicycle (among those who rode bicycles).
Could Not See Doctor Due To Cost	Adults who needed to see a doctor in the previous 12 months, but could not because of the cost.
Current Smoker	Adults who had ever smoked at least 100 cigarettes and who currently smoke cigarettes everyday or some days.
Current Smoker (Females, Aged 18-44)	Females aged 18-44 who had ever smoked at least 100 cigarettes and who currently smoke cigarettes everyday or some days.
Diabetes	Adults who reported ever being told by a doctor or health professional that they had diabetes (excluding gestational diabetes).
Disability	Adults who are limited in any way in any activities due to physical, mental, or emotional problems.
Drinking and Driving	Adults who reported driving when they had perhaps too much to drink in the previous 30 days.
Firearms	Adults who reported keeping a firearm in or around their home, including firearms kept in a garage, outdoor storage area, or motor vehicle.
Firearms (Loaded)	Adults who reported keeping a loaded firearm in or around their home, including loaded firearms kept in a garage, outdoor storage area, or motor vehicle.
General Health Status	Adults who reported their general health was 'fair' or 'poor'.
Heavy Drinking	Adults who consumed 60 or more drinks of alcohol in the past 30 days.
Heavy Drinking (Females, Aged 18-44)	Females aged 18-44 who consumed 60 or more drinks of alcohol in the past 30 days.
High Blood Cholesterol	Adults who were ever told by a doctor, nurse, or other health professional that they had high blood cholesterol (among those adults who ever had their blood cholesterol checked).
High Blood Pressure	Adults who were ever told by a doctor, nurse, or other health professional that they had high blood pressure.
High Risk Sexual Practices/ IV Drug Use	Adults who participated in one or more of the following behaviors in the previous 12 months: used intravenous drugs, were treated for a sexually transmitted or venereal disease, were given or received money or drugs in exchange for sex, or had anal sex without a condom.
High Risk Sexual Practices/ IV Drug Use (Females, Aged 18-44)	Females aged 18-44 who participated in one or more of the following behaviors in the previous 12 months: used intravenous drugs, were treated for a sexually transmitted or venereal disease, were given or received money or drugs in exchange for sex, or had anal sex without a condom.
Illicit Drug Use	Adults who reported using drugs for non-medical purposes in the last 12 months.
Illicit Drug Use (Females, Aged 18-44)	Females aged 18-44 who reported using drugs for non-medical purposes in the last 12 months.
Improper Food Handling	Adults who reported improper hand washing after handling raw meat or chicken (among those who handle raw meat or chicken).

Risk Factor Definitions

Risk Factor:	Definition:
Inadequate Fruit and Vegetable Consumption	Adults who did not consume five or more servings of fruits and vegetables per day.
Inadequate Fruit and Vegetable Consumption (Females, Aged 18-44)	Females aged 18-44 who did not consume five or more servings of fruits and vegetables per day.
No Dental Cleaning	Adults who have not had their teeth 'cleaned' by a dentist or dental hygienist in the previous 12 months.
No Dental Cleaning (Females, Aged 18-44)	Females aged 18-44 who have not had their teeth 'cleaned' by a dentist or dental hygienist in the previous 12 months.
No Dental Insurance	Adults who did not have dental insurance.
No Dental Visits	Adults who had not visited a dentist in the last 12 months.
No Health Care Coverage	Adults who did not have health care coverage.
No Influenza Vaccine	Adults who reported not receiving an influenza vaccine in the previous 12 months.
No Leisure Time Physical Activity	Adults who did not participate in leisure time physical activity.
No Mental Health Treatment	Adults who needed treatment for any mental or emotional problems in the previous five years, but were unable to get it.
No Pneumonia Vaccine (65+)	Adults aged 65 and older who reported never receiving a pneumonia shot.
No Smoke Detector	Adults who reported having no smoke detectors in their home.
No Smoke Detector/Testing	Adults who reported never deliberately testing all of the smoke detectors in their home or reported having no smoke detectors in their home.
No Usual Health Care Provider	Adults who did not have one person they considered a personal doctor or health care provider.
Obesity	An individual with a Body Mass Index (BMI) greater than or equal to 30.0 is considered obese. BMI is based on self-reported height and weight and is calculated by dividing weight in kilograms by the square of height in meters.
Overweight	An individual with a Body Mass Index (BMI) greater than or equal to 25.0 is considered overweight. BMI is based on self-reported height and weight and is calculated by dividing weight in kilograms by the square of height in meters.
Poor Mental Health	Adults who reported 14 or more days in the previous 30 days in which their mental health was not good.
Safety Restraints Not Always Used Among Children	Households where the oldest child under the age of 16 did not always use a safety restraint (e.g. child safety seat or seatbelt) when riding in a car (among those children who ride in cars).
Safety Restraints Not Always Used Among Young Children	Households where the oldest child under the age of five did not always use a safety restraint (e.g. child safety seat or seatbelt) when riding in a car (among those children who ride in cars).
Seatbelts Not Always Used Among Adults	Adults who did not always use seatbelts when driving or riding in a car.
Smokeless Tobacco Use	Adults who reported current use of smokeless tobacco products.
Sunburn	Adults who reported having a sunburn where the skin was red for more than 12 hours in the previous 12 months.
Tooth Loss (1+)	Adults who had one or more permanent teeth removed due to tooth decay or gum disease.
Tooth Loss (6+)	Adults who had six or more permanent teeth removed due to tooth decay or gum disease.

Data Sources and Notes - Alcohol, Tobacco, and Other Drugs

Mortality Data:

Rates are per 100,000 population.

Idaho source: Bureau of Health Policy and Vital Statistics, Division of Health, Idaho Department of Health and Welfare.

Notes: In 1999, the United States changed from the ninth revision (ICD-9) to the tenth revision of the International Classification of Diseases (ICD-10). The introduction of ICD-10 created major discontinuities in trend data. The data may not agree with previous publications.

Unless otherwise stated, the 1995-1998 data presented in this section have been revised using Modified ICD-9 codes and comparability ratios to allow for comparison with death statistics beginning in 1999 to 2004.

In addition, the age-adjusted mortality rates have been standardized to year 2000, a change from the 1940 standard. This new standard was adopted by the National Center for Health Statistics in 1999.

Alcohol Abuse:

Risk description:

Idaho Behavioral Risk Factor Surveillance System, Bureau of Health Policy and Vital Statistics, Division of Health, Idaho Department of Health and Welfare, and Centers for Disease Control and Prevention, National Center for Disease Prevention and Health Promotion.

Risk factors:

Alcohol use (adults):

Idaho source: Idaho Behavioral Risk Factor Surveillance System, Bureau of Health Policy and Vital Statistics, Division of Health, Idaho Department of Health and Welfare.

Alcohol use (students):

Idaho source: "Results of the 2003 Idaho Youth Risk Behavioral Survey and 2002 School Health Education Profile", Idaho Department of Education. "A Healthy Look at Idaho Youth: Results of the 2001 Idaho Youth Risk Behavioral Survey and 2000 School Health Education Profile", Idaho Department of Education.

Alcohol-related mortality:

Alcohol-induced deaths ICD-10 codes: E24.4, F10, G31.2, G62.1, G72.1, I42.6, K29.2, K70, K86.0, R78.0, X45, X65, Y15

Alcoholic liver disease ICD-10 code: K70

Notes: Causes of death attributable to alcohol include alcoholic psychoses, alcohol dependence syndrome, nondependent abuse of alcohol, alcoholic polyneuropathy, alcoholic cardiomyopathy, alcoholic gastritis, chronic liver disease and cirrhosis - specified as alcoholic, excessive blood level of alcohol, and accidental poisoning by alcohol, not elsewhere classified. The number of alcohol-induced deaths do not include accidents, homicides, and other causes indirectly related to alcohol use.

The list of codes included in alcohol-induced causes was expanded for ICD-10 to be more comprehensive. Data for 1999 through 2004 are not comparable to data for 1995 through 1998.

Tobacco Use:

Risk description:

Idaho Behavioral Risk Factor Surveillance System, Bureau of Health Policy and Vital Statistics, Division of Health, Idaho Department of Health and Welfare, and Centers for Disease Control and Prevention, National Center for Disease Prevention and Health Promotion.

Risk factors:

Tobacco use (adults):

Idaho source: Idaho Behavioral Risk Factor Surveillance System, Bureau of Health Policy and Vital Statistics, Division of Health, Idaho Department of Health and Welfare.

Tobacco use (students):

Idaho source: "Results of the 2003 Idaho Youth Risk Behavioral Survey and 2002 School Health Education Profile", Idaho Department of Education. "A Healthy Look at Idaho Youth: Results of the 2001 Idaho Youth Risk Behavioral Survey and 2000 School Health Education Profile", Idaho Department of Education.

Data Sources and Notes - Alcohol, Tobacco, and Other Drugs

Tobacco-related mortality:	<p>Malignant neoplasm of trachea, bronchus, and lung ICD-10 codes: C33-C34</p> <p>Major cardiovascular diseases ICD-10 codes: I00-I78</p> <p>Chronic lower respiratory diseases ICD-10 codes: J40-J47</p> <p>Notes: Major cardiovascular mortality includes conditions such as Acute rheumatic fever, Chronic rheumatic heart diseases, Hypertensive diseases, Ischemic heart diseases, Pulmonary heart disease and diseases of pulmonary circulation, Other forms of heart disease, Cerebrovascular diseases, and Diseases of arteries, arterioles, and capillaries. Circulatory system diseases not included are Diseases of veins, lymphatic vessels, and lymph nodes (not elsewhere classified), and Other and unspecified disorders of the circulatory system.</p> <p>Chronic lower respiratory diseases mortality includes conditions such as bronchitis (chronic and unspecified), emphysema, and asthma.</p>
Illicit Drug Use:	
Risk description:	Idaho Behavioral Risk Factor Surveillance System, Bureau of Health Policy and Vital Statistics, Division of Health, Idaho Department of Health and Welfare, and Centers for Disease Control and Prevention, National Center for Disease Prevention and Health Promotion.
Risk factors:	
Drug use (adults):	Idaho source: Idaho Behavioral Risk Factor Surveillance System, Bureau of Health Policy and Vital Statistics, Division of Health, Idaho Department of Health and Welfare.
Drug use (students):	Idaho source: "Results of the 2003 Idaho Youth Risk Behavioral Survey and 2002 School Health Education Profile", Idaho Department of Education. "A Healthy Look at Idaho Youth: Results of the 2001 Idaho Youth Risk Behavioral Survey and 2000 School Health Education Profile", Idaho Department of Education.
Drug arrests:	Source: Idaho Uniform Crime Reporting Program, Bureau of Criminal Identification, Idaho State Police.
Drug-induced mortality	<p>Drug-induced causes of deaths ICD-10 codes: D52.1, D59.0, D59.2, D61.1, D64.2, E06.4, E16.0, E23.1, E24.2, E27.3, E66.1, F11.0-F11.5, F11.7-F11.9, F12.0-F12.5, F12.7-F12.9, F13.0-F13.5, F13.7-F13.9, F14.0-F14.5, F14.7-F14.9, F15.0-F15.5, F15.7-F15.9, F16.0-F16.5, F16.7-F16.9, F17.0, F17.3-F17.5, F17.7-F17.9, F18.0-F18.5, F18.7-F18.9, F19.0-F19.5, F19.7-F19.9, G21.1, G24.0, G25.1, G25.4, G25.6, G44.4, G62.0, G72.0, I95.2, J70.2-J70.4, L10.5, L27.0, L27.1, M10.2, M32.0, M80.4, M81.4, M83.5, M87.1, R78.1-R78.5, X40-X44, X60-X64, X85, and Y10-Y14.</p> <p>Drug-induced deaths include deaths due to drug psychosis, drug dependence, nondependent use of drugs not including alcohol and tobacco, accidental poisoning by drugs, medicaments, and biologicals, suicide by drugs, medicaments, and biologicals, assault from poisoning by drugs and medicaments, and poisoning by drugs, medicaments, and biologicals, undetermined whether accidental or purposely inflicted. Drug-induced deaths do not include accidents, homicides, and other causes indirectly related to drug use. Types of drugs listed on the death certificate include prescriptions, over-the-counter drugs, and narcotics.</p> <p>The list of codes included in drug-induced causes was expanded for ICD-10 to be more comprehensive. Data for 1999 through 2004 are not comparable to data for 1995 through 1998.</p> <p>ICD-10 Code F17.9: unspecified mental and behavioural disorder due to use of tobacco (chain, former, life long, or packs per day).</p> <p>The question 'Did tobacco use contribute to cause of death?' was added to the death certificate in 2003. Prior to 2003, deaths that were ill-defined or had an unknown cause of mortality listed on the death certificate were coded to ICD-10 codes R96-R99.9. Beginning in 2003, deaths that were ill-defined or had an unknown cause of mortality listed on the death certificate were coded to ICD-10 codes R96-R99.9, if the question 'Did tobacco use contribute to cause of death?' was marked no or unknown. If the question 'Did tobacco use contribute to cause of death?' was marked yes or probably, deaths that were ill-defined or had an unknown cause of mortality listed on the death certificate were coded to ICD-10 code F17.9. Therefore, data for 2003 and 2004 are not comparable to data for 1999 through 2002.</p>

Data Sources and Notes - Diseases and Conditions

All Diseases and Conditions:

Mortality: Source: Bureau of Health Policy and Vital Statistics, Division of Health, Idaho Department of Health and Welfare.

Notes: In 1999, the United States changed from the ninth revision (ICD-9) to the tenth revision of the International Classification of Diseases (ICD-10). The introduction of ICD-10 created major discontinuities in trend data. The data may not agree with previous publications.

Unless otherwise stated, the 1995-1998 data presented in this section have been revised using Modified ICD-9 codes and comparability ratios to allow for comparison with 1999.

In addition, the age-adjusted mortality rates have been standardized to year 2000, a change from the 1940 standard. This new standard was adopted by the National Center for Health Statistics in 1999.

Work-related injury mortality (occurring in Idaho – excludes suicides)	<p>ICD-10 codes: V01-X59, X85-Y09, Y35-Y36, Y40-Y86, Y87.1, Y88, Y89.0-Y89.1</p> <p>Note: These data reflect events occurring in Idaho and are not comparable to the Idaho resident injury data presented in the Intentional and Unintentional Injury sections.</p> <p>Employment Source: Quarterly Report of Covered Employment and Wages 1995 through 2004, Idaho Commerce and Labor.</p>

Technical Notes

Technical Notes

Age-Adjusted Mortality Rates Standardized to the Year 2000 U.S. Standard

Age adjustment is a statistical technique used to standardize rates. The technique is employed when comparing two or more populations with different age distributions. Age-adjusted rates are artificial measures for comparison purposes only and should not be used to measure the absolute magnitude of a health issue. To allow for comparison, the same standard population must be used. If different standard populations are used to compute the age-adjusted rates (1940 and 2000, for example), then the age-adjusted rates are NOT comparable. Statistically, it is a weighted average of the age-specific death rates, where the weights represent the fixed population proportions by age.

Beginning with data (calendar) year 1999, the National Center for Health Statistics (NCHS) implemented a new standard for age-adjusted death rates. The new standard is based on year 2000 U.S. population, and it replaces the existing 1940 standard million population that has been widely used for over 50 years. The change in the population standard from 1940 to the year 2000 affects the magnitude of the age-adjusted rates. Rates based on the year 2000 standard will be larger than rates based on the 1940 standard because the year 2000 standard gives more weight to death rates at the older age, where mortality is higher.

Cause-of-Death Classification

Mortality statistics are compiled in accordance with the World Health Organization (WHO) regulations, which specify that member nations, including the United States, classify and code causes of death in accordance with the International Statistical Classification of Diseases and Related Health Problems. The tenth revision of the International Classification of Diseases (ICD-10) was implemented in the United States beginning with deaths occurring in 1999 and replaces the ninth revision of the ICD (ICD-9), which was used from 1979 through 1998. Some changes from ICD-9 to ICD-10 include:

1. ICD-10 is far more detailed than ICD-9, with about 8,000 categories compared with 4,000 categories.
2. ICD-10 uses 4-digit alphanumeric codes, compared with 4-digit numeric codes in ICD-9.
3. Some cause-of-death titles have been changed, and conditions have been regrouped.
4. Some cause-of-death coding rules have been changed.

Comparability Ratio

The change from ICD-9 to ICD-10 may result in discontinuities in cause-of-death trends. These discontinuities are measured using comparability ratios. The National Center for Health Statistics (NCHS) developed comparability ratios to measure the level of agreement between classification systems for causes of death.

The comparability ratio is the result of a study completed by the NCHS in which a sample of U.S. mortality records was coded by both the new (ICD-10) and the old revision (ICD-9) codes. A comparability ratio of 1.00 indicates that the same number of deaths was assigned to a particular cause whether ICD-9 or ICD-10 was used. A comparability ratio of less than 1.00 indicates fewer deaths would be coded to the cause of death using ICD-10 compared with ICD-9, solely because of the revision of the ICD. For example, a ratio of 0.83 indicates there were 17 percent fewer deaths ($1.00 - 0.83$) for this cause because of the code revision. A comparability ratio of more than 1.00 indicates more deaths occurred from this cause using ICD-10 compared with ICD-9, only because of the implementation of ICD-10. A ratio of 1.19 indicates 19 percent more deaths (absolute difference of $1.00 - 1.19$) were attributed to the cause using ICD-10 than would have been using ICD-9. Additional information on Modified ICD-9 codes can be found on the NCHS website.

Technical Notes

Life Expectancy

Data used to calculate Idaho life expectancy are based on July 1, 2004, population estimates from the U.S. Bureau of the Census, age-specific population estimates computed by the Bureau of Health Policy and Vital Statistics, and 2004 Idaho resident mortality rates. Average number of years of life remaining (oe_x) is the expectation of life for those who survived to age x.

$${}^oe_x = T_x / l_x$$

T_x is the total time lived beyond age x by all individuals of the life table proportion alive at age x; l_x is the number of persons who survive to the exact age marking the beginning of each age interval. The number alive at age 0 (l_0) is taken arbitrarily as 100,000.

Years of Potential Life Lost (YPLL)

Years of potential life lost (YPLL) is a statistic used to measure the number of years of life lost in a population when persons in that population die prematurely. YPLL provides valuable information regarding the causes of death that contribute most significantly to premature mortality. For example, in 2004, Accidents was the fourth-leading cause of death of Idahoans and accounted for 5.9 percent of all resident deaths. However, Accidents was the second leading cause of premature death under age 75 and accounted for 14.3 percent of all YPLL in 2004.

For this report, a standard of 75 years of age was chosen to calculate YPLL. Although other standards are sometimes used (e.g., 65 years, 70 years, or life expectancy), 75 years was chosen because it is the most frequently used standard by the National Center for Health Statistics. The standard of 75 years is not used with the implication that it is the maximum potential for years of life. Rather, it is used because deaths before age 75 are considered to be premature.

Behavioral Risk Factor Rankings

Rankings of risk factors are determined using prevalence figures (number in bottom left of cell) rather than the population estimates (number in bottom right of cell). For this reason, a risk factor may be listed as having a higher rank than another risk factor with a lower prevalence even if the lower ranked risk factor represents a larger population. This can happen due to rounding or when one risk factor population differs from another. For example, the population of women upon which the cervical cancer screening risk factor is based excludes women who have had a hysterectomy, whereas the personal health care provider risk factor is based on all women.
